PRODUCT DESCRIPTION:

TRIPLE STRIKE is a concentrated liquid suspension of superfine gypsum, enhanced with alum. It is a revolutionary, one step treatment for algal blooms in farm dams and other water bodies.

TRIPLE STRIKE has a 3-way action for highly effective results:

- The alum coagulates the algae.
- The combination of alum and gypsum flocculates the algae.
- The alum and gypsum form a blanket over the algae on the floor of the water body which absorbs phosphorus and toxins from the water, inhibiting new algal growth.

TRIPLE STRIKE doesn't kill the algae initially. Its action is to starve the algae of nutrients over time. In most situations, the algae will stay on the bottom and decompose over a 2-3 week period.

TRIPLE STRIKE will generally lower the pH of the water by 0.5-1.0 pH units. This will assist in preventing further algal blooms.

APPLICATION RATES:

The rate of application will depend on the intensity of the algae within the water storage that you intend on treating. **TRIPLE STRIKE** should first be diluted to a minimum of 2:1 ratio (2 parts water to 1 part **TRIPLE STRIKE**) and then applied over the water surface via a hand held spray gun or boom spray jet for best results. After

TRIPLE STRIKE has been applied the product particles will maximise their contact with the algae and produce a cloud within the water profile and then later settling to the bottom of the water. Please read the application rate chart to select the best application rate for your treatment.

	ALGAE INTENSITY	
	Light	Heavy
TRIPLE STRIKE rate per megalitre	60-70	90-110
